

Ground H2O Monitoring Wells 11-16 Transect 3

Cross sectional profile of ground water readings from four wells and the surveyed measurement of the river level. This is tied in with the profile of the ground elevation along the ground water well line. With this data you can see the relationship the ground water has with the corresponding ground surface and also with the river level.

This reading is from the low water time of year (Fall), and it shows that the meadow is losing water to feed the river.
